

一. 数学期望

1. 离散型随机变量

$$\textcircled{1} E(X) = \sum_{i=1}^{+\infty} x_i P(X=x_i)$$

■ 例: 考虑 $p_i = P(X=x_i=3^i/i) = 2/3^i, i=1,2,\dots$, 则 $\sum_{i=1}^{\infty} |x_i p_i| = \sum_{i=1}^{\infty} 2/i$ 发散, 因此不存在期望

分布	期望
$B(n, p)$	np
$\pi(\lambda)$	λ
$G(p)$	$\frac{1}{p}$
$NB(r, p)$	$\frac{r}{p}$

证: $\textcircled{1} X \sim B(n, p)$

$$\begin{aligned} E(X) &= \sum_{k=0}^{+\infty} k P(X=k) = \sum_{k=0}^{+\infty} k C_n^k p^k (1-p)^{n-k} \\ &= \sum_{k=0}^{+\infty} \frac{n!}{(k-1)!(n-k)!} p^k (1-p)^{n-k} \\ &= n \sum_{k=1}^{+\infty} C_{n-1}^{k-1} p^k (1-p)^{n-k} \\ &= np [p + (1-p)]^{n-1} \\ &= np. \end{aligned}$$

$\textcircled{2} X \sim \pi(\lambda)$

$$\begin{aligned} E(X) &= \sum_{k=0}^{+\infty} e^{-\lambda} \frac{\lambda^k}{k!} \cdot k \\ &= \left(\sum_{k=1}^{+\infty} e^{-\lambda} \frac{\lambda^{k-1}}{(k-1)!} \right) \cdot \lambda \\ &= \lambda \end{aligned}$$

$\textcircled{3} X \sim G(p)$

$$E(X) = \sum_{k=1}^{+\infty} k \cdot (1-p)^{k-1} p$$

$$\text{令 } f(x) = \sum_{k=1}^{+\infty} p x^k = \frac{p}{1-x}$$

$$f'(x) = \sum_{k=1}^{+\infty} k p x^{k-1} = \frac{p}{(1-x)^2}$$

$$\Rightarrow E(X) = f'(1-p) = \frac{1}{p}$$

$\textcircled{4} X \sim NB(r, p)$

$$E(X) = \sum_{k=r}^{+\infty} k \cdot C_{k-1}^{r-1} p^r (1-p)^{k-r}$$

$$= \sum_{k=r}^{+\infty} k \frac{(k-1)!}{(r-1)!(k-r)!} p^r (1-p)^{k-r}$$

$$= r p^r \sum_{k=r}^{+\infty} C_{k-r}^r (1-p)^{k-r}$$

$$\text{令 } k' = k-r, E(X) = r p^r \sum_{k'=0}^{+\infty} C_{k'+r}^r (1-p)^{k'}$$

$$= r p^r \frac{1}{[1-(1-p)]^{r+1}} = \frac{r}{p} \quad \square$$

$\textcircled{5}$ ■ 已知 X 是取值非负的离散型随机变量, 则

$$E(X) = \sum_{n=1}^{+\infty} P(X \geq n) = \sum_{n=0}^{+\infty} P(X > n)$$

$$\text{证: } E(X) = \sum_{n=1}^{+\infty} n P(X=n)$$

$$= P(X=1) + 2P(X=2) + \dots + nP(X=n) + \dots$$

$$= P(X \geq 1) + P(X \geq 2) + \dots + P(X \geq n) + \dots$$

$$= \sum_{n=1}^{+\infty} P(X \geq n) = \sum_{n=0}^{+\infty} P(X > n)$$

2. 连续型随机变量

$$\textcircled{1} E(X) = \int_{-\infty}^{+\infty} f_X(x) \cdot x dx$$

若 $\int_{-\infty}^{+\infty} x f(x) dx$ 不绝对收敛, 则称 X 的期望不存在.

■ 例: 已知 X 的密度 $f(x) = \frac{1}{\pi(x^2+1)}$ (柯西分布), 则

$$\int_{-\infty}^{+\infty} |x| f(x) dx = 2 \int_0^{+\infty} \frac{x}{\pi(x^2+1)} dx = +\infty.$$

X 的期望不存在.

分布	期望
$U(a, b)$	$\frac{b+a}{2}$
$\text{Exp}(\lambda)$	$\frac{1}{\lambda}$
$\Gamma(\alpha, \lambda)$	$\frac{\alpha}{\lambda}$
$N(\mu, \sigma^2)$	μ

证: $\textcircled{1} X \sim U(a, b)$

$$E(X) = \int_a^b \frac{1}{b-a} x dx = \frac{1}{2(b-a)} (b^2 - a^2) = \frac{a+b}{2}$$

$\textcircled{2} X \sim \text{Exp}(\lambda)$

$$E(X) = \int_0^{+\infty} \lambda e^{-\lambda x} x dx = - \int_0^{+\infty} x d e^{-\lambda x}$$

$$= - \left[0 - \int_0^{+\infty} e^{-\lambda x} dx \right]$$

$$= - \frac{1}{\lambda} e^{-\lambda x} \Big|_0^{+\infty}$$

$$= \frac{1}{\lambda}$$

$\textcircled{3} X \sim \Gamma(\alpha, \lambda)$

$$E(X) = \int_{-\infty}^{+\infty} \frac{x^{\alpha-1} \lambda^\alpha e^{-\lambda x}}{\Gamma(\alpha)} \cdot x dx$$

$$= \frac{\lambda^\alpha}{\Gamma(\alpha)} \int_{-\infty}^{+\infty} x^\alpha e^{-\lambda x} dx$$

$$= \frac{\lambda^\alpha}{\Gamma(\alpha)} \left(\int_{-\infty}^{+\infty} x^\alpha e^{-x} dx \right) \cdot \left(\frac{1}{\lambda} \right) \cdot \left(\frac{1}{\lambda} \right)^\alpha$$

$$= \frac{\lambda^\alpha}{\lambda^{\alpha+1} \Gamma(\alpha)} \cdot \Gamma(\alpha+1) = \frac{\alpha}{\lambda}$$

④ $X \sim N(\mu, \sigma^2)$

$$\begin{aligned} E(X) &= \int_{-\infty}^{+\infty} x \cdot \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}} dx \\ &= \int_{-\infty}^{+\infty} (t+\mu) \cdot \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{t^2}{2\sigma^2}} dt \\ &= \frac{1}{\sqrt{2\pi}\sigma} \left[\frac{1}{2} \int_{-\infty}^{+\infty} e^{-\frac{t^2}{2\sigma^2}} dt + \mu \int_{-\infty}^{+\infty} e^{-\frac{t^2}{2\sigma^2}} dt \right] \\ &= \frac{1}{\sqrt{2\pi}\sigma} \cdot \mu \cdot \sqrt{2\pi}\sigma \\ &= \mu. \end{aligned}$$

离散也可.

⑤ 期望和分布函数的关系

已知随机变量 X 的分布函数为 $F(x)$, 则有
 $E(X) = \int_{-\infty}^{+\infty} x dF(x) = \int_0^{+\infty} (1 - F(x)) dx - \int_{-\infty}^0 F(x) dx$.
 当 X 取值非负时, 有 $E(X) = \int_0^{+\infty} (1 - F(x)) dx$

$$\begin{aligned} \text{证: } E(X) &= \int_{-\infty}^{+\infty} x f_X(x) dx \\ &= \int_{-\infty}^{+\infty} \int_0^x dy f_X(x) dx \\ &= \int_{-\infty}^0 dy \int_y^{+\infty} f_X(x) dx + \int_0^{+\infty} dy \int_y^{+\infty} f_X(x) dx \\ &= \int_{-\infty}^0 dy (0 - F_X(y)) + \int_0^{+\infty} dy (1 - F_X(y)) \\ &= \int_0^{+\infty} 1 - F_X(y) dy - \int_{-\infty}^0 F_X(y) dy. \quad \square \end{aligned}$$

■ 例: 已知 $X \sim U(-1, 2)$, $Y = \max\{X, 0\}$, 求 $E(Y)$

解: ① $Y \geq 0$

$$F_Y(y) = \begin{cases} 0, & y < 0 \\ \frac{1}{3}, & y = 0 \\ \frac{1}{3} + \frac{1}{3}y, & 0 < y < 2 \\ 1, & y = 2 \end{cases}$$

$$\begin{aligned} \Rightarrow E(Y) &= \int_0^{+\infty} (1 - F_Y(y)) dy \\ &= \int_0^2 -\frac{1}{3}y + \frac{2}{3} dy \\ &= -\frac{1}{6}y^2 + \frac{2}{3}y \Big|_0^2 \\ &= -\frac{2}{3} + \frac{4}{3} \\ &= \frac{2}{3}. \end{aligned}$$

$$E(Y) = \frac{2}{3}$$

Y 既非离散型也非连续型.

3. 随机变量函数的期望.

离散型随机变量 X 的概率分布为 $p_i = P(X = x_i)$, g 为实单值函数, 若 x_i 有限或 $\sum_i |g(x_i)| p_i < \infty$, 则随机变量 $Y = g(X)$ 的数学期望或均值为 $E(Y) = E(g(X)) = \sum_i g(x_i) p_i$

■ 定理的意义在于不用先求 Y 的分布再算均值

$$\begin{aligned} \text{证: } E(Y) &= \sum_k y_k P(g(X) = y_k) \\ &= \sum_k y_k \sum_{j: g(x_j) = y_k} P(X = x_j) \\ &= \sum_k \sum_{j: g(x_j) = y_k} g(x_j) P(X = x_j) \\ &= \sum_j g(x_j) P(X = x_j) \quad \square \end{aligned}$$

■ 定理的意义在于不用先求 Y 的分布再算均值

$$\begin{aligned} \text{证: } E(Y) &= \int_{-\infty}^{+\infty} y f_Y(y) dy \\ &= \int_{-\infty}^{+\infty} g(x) \cdot f_X(x) dx \quad \square \end{aligned}$$

4. 随机向量及其函数的期望.

$$\begin{aligned} \text{① } Z = (X, Y), \quad E(Z) &= \sum_i \sum_j Z P(X = x_i, Y = y_j) \quad \text{离散} \\ &= \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} z f_{X,Y}(x, y) dx dy \quad \text{连续} \end{aligned}$$

离散随机向量函数的期望

随机变量 $Z = g(X, Y)$ 是离散型随机变量 X, Y 的函数。 X, Y 的概率分布为 $p_{ij} = P(X = x_i, Y = y_j)$, g 为实单值函数, 若 x_i, y_j 有限或 $\sum_{i,j} |g(x_i, y_j)| p_{ij} < \infty$, 则随机变量 $Z = g(X, Y)$ 的数学期望或均值为 $E(Z) = E(g(X, Y)) = \sum_{i,j} g(x_i, y_j) p_{ij}$

$X=0$	0	1	0
$X=1$	1	0	-1

$$\Rightarrow E(Z) = 0.21 + 0.15 - 0.15 = 0.21$$

■ 已知随机变量 X, Y 的概率密度为 $f(x, y) = \begin{cases} \frac{3}{2x^3y^2} & x > 1, \frac{1}{x} < y < x \\ 0 & \text{else} \end{cases}$ 求 $E(Y), E(\frac{1}{XY})$

(2) 因为 $\begin{cases} x > 1 \\ x > \frac{1}{y} \\ x > y \end{cases}$ 要分类讨论.

$$= \Rightarrow \int_1^{+\infty} \frac{1}{x^2} \ln x dx$$

$$= \Rightarrow \int_1^{+\infty} \ln x dx x^{-2} \cdot (-\frac{1}{2})$$

$$= -\frac{3}{2} \left[x^{-2} \ln x \right]_1^{+\infty} - \int_1^{+\infty} x^{-3} dx$$

方差的性质

- 对于常数 C , 有 $D(C) = 0$
- 对于常数 C , 随机变量 X , 有 $D(CX) = C^2 D(X)$
- 对于常数 B, C , 随机变量 X , 有 $D(B+CX) = C^2 D(X)$
- 对于两个随机变量 X, Y , 有 $D(X+Y) = D(X) + D(Y) + 2E[(X-E(X))(Y-E(Y))]$
- 假设随机变量 $\{X_i\}$ 相互独立, 有 $D(\sum_i X_i) = \sum_i D(X_i)$
- $\frac{D(X)}{E(X)^2} \leq \frac{E[(X-E(X))^2]}{E(X)^2}$
- $D(X) \equiv 0 \Leftrightarrow P(X=C) = 1 \nRightarrow X \equiv C$

随机变量标准化

已知随机变量 X 的期望 $E(X)$ 和方差 $D(X)$, $Y = \frac{X-E(X)}{\sqrt{D(X)}}$ 为 X 的标准化

- 对于标准化的随机变量我们有 $E(Y) = 0, D(Y) = 1$
- 例如, 对于 $X \sim N(\mu, \sigma^2)$, 有 $Y = (X-\mu)/\sigma$, 且 $E(Y) = 0, D(Y) = 1$

三、协方差和相关系数

1. 定义

$$\rho_{XY} = \frac{\text{Cov}(X, Y)}{\sqrt{D(X)}\sqrt{D(Y)}} = E(\tilde{X}\tilde{Y}), \tilde{X} = \frac{X - E(X)}{\sqrt{D(X)}}$$

2. 常用结论

$$E(XY) = E(X)E(Y) + \text{Cov}(X, Y)$$

$$\begin{aligned} \text{证: } \text{Cov}(X, Y) &= E[(X - E(X))(Y - E(Y))] \\ &= E(XY - XE(Y) - E(X)Y + E(X)E(Y)) \\ &= E(XY) - E(X)E(Y) \end{aligned}$$

$$E(XY) = E(X)E(Y) + \text{Cov}(X, Y)$$

$$D(X+Y) = D(X) + D(Y) + 2\text{Cov}(X, Y)$$

$$\begin{aligned} \text{证: } D(X+Y) &= E[(X+Y - E(X+Y))^2] \\ &= E\left\{\left[(X - E(X)) + (Y - E(Y))\right]^2\right\} \\ &= D(X) + D(Y) + 2\text{Cov}(X, Y) \end{aligned}$$

$$D(\sum_{i=1}^n X_i) = \sum_{i=1}^n D(X_i) + 2 \sum_{i < j} \text{Cov}(X_i, X_j)$$

$$\begin{aligned} \text{证: } D(\sum_{i=1}^n X_i) &= D(\sum_{i=1}^{n-1} X_i + X_n) = D(\sum_{i=1}^{n-1} X_i) + D(X_n) \\ &\quad + 2\text{Cov}(\sum_{i=1}^{n-1} X_i, X_n) \\ &= D(\sum_{i=1}^{n-1} X_i) + D(X_n) + 2 \sum_{i=1}^{n-1} \text{Cov}(X_i, X_n) \end{aligned}$$
